The rising trend of DJIA is better than S&P and NASDAQ, now having strong white candlestick to shoot up.

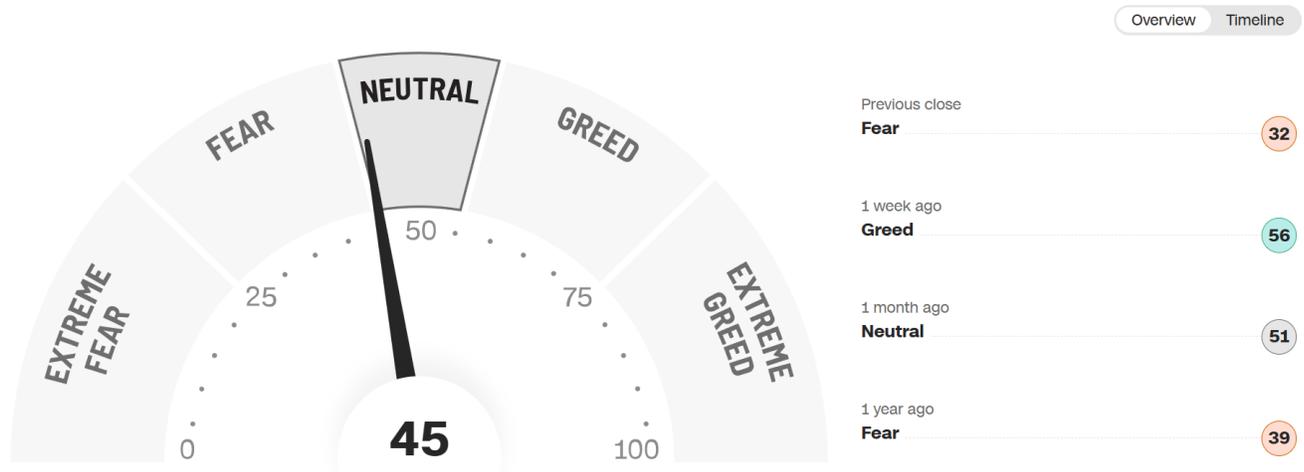

BTC broke the complicated Head & Shoulders necklines and started to fall, but reached the Fibonacci series of 0.50

*Risk disclosure: Price can go up and down at any moment, use free money to trade and bear the risk according to your own capital;

## North East West South is NEWS

U.S. stocks rebounded strongly on Friday (February 6), with the Dow Jones Industrial Average breaking through the 50,000-point mark, marking its biggest single-day gain since May of last year. President Trump attributed this milestone to tariff policies and predicted the Dow would reach 100,000 points before the end of his term. Following the stock market rally, Trump posted on Truth Social on Friday, "The Dow has broken the 50,000-point mark for the first time in history! Congratulations to America!"

According to Forbes magazine, Elon Musk's net worth is a staggering \$834.8 billion, but he posted on the X platform late on February 4, 'money can't buy happiness'.

NVIDIA plans not to release any new gaming GPUs in 2026 and confirmed that the RTX 60 series has been delayed until 2027 or later. This will be the first time in nearly 30 years that NVIDIA has not released any new gaming GPUs for an entire year.

Handelsblatt published a commentary stating that the "Make in Europe" initiative proposed by German and European automakers, intended to protect the domestic automotive industry, will instead encourage Chinese automakers to further expand into Europe. Die Welt's analysis points out that Europe considers climate protection its moral responsibility and a core policy, while China has profited immensely from Europe's emissions reduction efforts and expanded its political and economic influence.

Taiwan Semiconductor Manufacturing Company (TSMC) has opened its second factory in Kumamoto, Japan. The meeting between TSMC's CEO and Prime Minister Taikachi was significant for Japan's semiconductor ambitions and economic security. The new facility is a joint venture with partners such as Sony Semiconductor Solutions, Denso, and Toyota, and it is part of Japan's broader strategy to revive its semiconductor dominance.

## World Observation

Day	1448
Russia/Ukraine Conflict	

# AI & Unemployment

When people are worrying whether the recent trend of AI is a bubble or just over-estimation, DJIA responded by a big white candlestick of a rise of 1206 points and wiped out all negative thoughts. It brings the index to over the barrier of 50,000 points for the first time and closed at 50115.67. Browsing world wide market, the highest level is Nikkei 225 of Tokyo which is at 54253.68, and DJIA is the second one that break the level of 50,000 points. But both trends are very similar.

Who will be the King of Kings? Who will be the Lord of Lords? Just wide open your eyes and see! Among this festive mood, it buries a horrible worry that AI will replace human employment seats. It is not a worry of the future, already turned to problem of nowadays. It's a problem that we cannot put aside, it is happening around us on left and right, through day and night.

The recent saying of *Long Hardware and Short Software* actually is caused by AI replacing software engineers. Not only led to a bloody week of dropping in stock market, saying whatsoever black swan, grey rhino, black February....., but also a drop in property market of Bay Area. Why? It is said that the recent trend led to a lot of software engineers lost their job in Silicon Valley, therefore they have to sell out their large house in Bay Area or around Silicon Valley, or need not to rent such a large house, and just move to a small flat in a multi-storey building. What they can realize is that at first the basic level post is cut, later medium level post, and now only remained the high management level to supervise the AI. They can feel that in the future, AI will in turn supervise the managers. For now, AI can teach AI, robot can have maintenance on other robots. Why do we still need human beings to work or to supervise?

Luxury apartment for human may change to store room for robots to stay in and get them charged only. When people are afraid of losing their jobs, they would not stay in those extravagant houses any more and have to sell them out and thus lead to a drop in property market. It is just the beginning and more will be coming.

In the past, when economic recession comes, a lot of people just say they would use their time to go out to be a taxi driver or be a take away deliverer to pass the strait. When the hard times has gone, they can go back to their normal job. But now taxi and Uber will be replaced by robotaxi, takeaway service will be done by drone and auto delivery machine. They have to give up such lower class but practical hopes.

It is not a problem of advanced economy but will be extended to other parts of the world. APPL and TSLA established their factory in China and pushed them to have the Huawei and BYDDY as keen competitors. Now they are shifting their business to India, very soon will push India into their automation. The population of India now is 1.47 billion and is going to break the 1.50 billion soon. But in China, because of young people *lying flat* and would not like to get marry, it will go down to 1.39 billion soon. So, after full automation of India, will they follow the path of China? Or will arouse another kind of problem. Japan has gone through a period of lost 30 years because of economic growth to the top and went down and diminishing population, and now is the first country recovered from over-advanced economy. Japan is one of the chip-4 now. So, no problem indeed if you can upgrade yourself.

To over come AI, you must know AI from head to toe first. That is, you have to learn AI to a very deep magnitude. I always have a special emphasis saying that a successful investor should have a market diary on their own. Do you still remember what happened in early November before the Hunter Moon? PLTR started to recruit high school students to learn AI instead of college graduates. They considered current college education can't meet with such a challenge, even though the first batch is just 20 seats, and the result may take years to verify, but a new page already turned on. Everyone has to learn AI.

Be sure that KK park also has their AI advertisement, don't fallen into their traps. They appeared as large firms like GOOG or MSFT launching out AI lectures, after you pay the school fee, your computer will black off and cannot see anything, for that website is a false website, not genuine website. Take care! I have asked the AI to list out the current AI chatboard and let investor to read, remember when you join the subscription, no need to pay for one-year fee first, better try the one-week or one-month first and increase step by step. Or you can refer to The Express of [20251209](#), 20251107, 20251027, 20250815, 20250814, 20250813, 20250630 and 20250214.

When you want to buy at low, you should choose RDW or FLY (see page 7)

When TSM is on record high, no need to worry the war on Taiwan, this is the strongest silicon shield. It not only protects the chips in Taiwan, but shielding the whole chip-4 semiconductor industry.

## Market Observation

### Year of Crypto or AI ?

**WTI**  
(Petroleum)  
**\$63.51**

Catherine Wood once said that year 2026 is a year of crypto, now I understand it does not mean it will rise or lead the market to rise, but it will give a surprise to the market by a running of roller coaster.

Bitcoin had dropped from height of October 6 which is 125251 to 63119 of Feb 5. It is time for rebounding according to the Fibonacci series of 0.50. So, if you enter into the market today, you can proudly tell others you are buying at a level lower than Cathy Wood who purchased last Mon and Tue. Even if you entered that day, you are exactly at the same level as she is. Quite nice indeed! Already said the room for falling is quite limited after a drop of 4 months. COIN is in Wave 5 of falling wave and turned upward after the Nine flying Daggers, that is 8 black candlesticks will be followed by a white rebound on the 9<sup>th</sup> day according to the Fibonacci series of 1,1,2,3,5,8.....

If you have a market diary, you can check that in 20250826, the AI said MSTR will rise 573.85% in one month and rise 662% in Dec 2025. At that time, it was \$358.13 and now \$134.93. Therefore, you can know that even AI is very powerful, still have a lot of things unable to do. So, when you understand AI more, you can do something they are unable to do, thus you will be not be eliminated by another capable AI user, and you can kick those incapable users out of the market instead of being kicked off.

AI is unable to tell you when the highest point of the market will come, so any falling will just aroused terror in the market and afraid of black swan or gey rhino, but actually another mini golden pit. If you have a market diary, you can realize the change started from Nov when all financial reports are in good result but their price just go horizontally and not upward. That's why NASDAQ, TSLA and NVDA reached lower part of the ranging zone, people afraid of bloody bear market. But at the same time TSM near record high, no one feels bull. But when AMZN and PLTR broke the lower support, even S&P is still in the middle point, people said bar market already started.

Due to leak of hydrogen, the launching of Artemis II is postponed, the launching day is on 11<sup>th</sup> Mar 2026. Now, most of the Mars Landing stocks are on record high or near record high, but some related stocks still having a chance to catch up during the mini golden pit of this month. They are RDW, they do not manufacture rockets, but only systems of supply of electricity for usage in inside the rockets. Price at very low level now. Also, ONDS, they do not sell drones, but only communications among them for supervising, price retreating. ASTS, using blue bird satellites for mobile, that is without the Elon Musk Starlink can have the same function on your I-phone now, price retreating. FLY is a commercial space company at a very low-price level now. LUNR is a commercial space centre at Houston, aiming at the moon project and not Mars, price retreating but having a big white candlestick upward now.

So, is the current AI a bubble or just overestimated? If it is just too optimistic or having overestimation on individual stocks, its no wrong. After the correction or mini golden pit, it will burst up again. Even February is said to be a drop in most of the times, but with such a space project coming in March, how can we say the bull market ends here?

It is not an end but a beginning. From another angle, people say year 2026 is the year zero of AI. Some people are always waiting for AGI (super AI), but according to the *Nature*, the AGI era has already started. It is a report by California University San Diego campus, the change is as thrilling as Nicolaus Copernicus, earth is not the centre of universe, the sun is the centre and the earth is circulating round the sun, not the sun circulating round the earth.

What is AGI era? By 2030, 70-80% of the current job will be replaced by AI. It would not come all of a sudden, instead it would come gradually. Based upon early 2026, by Dec 2026, 10% of the current human job will be replaced by AI, and Dec 2027 will be 20%, Dec 2028 will be 40%, Dec 2029 will be 60%, Dec 2030 will be 70-80% based upon the standard of early 2026. The coverage will be not just blue collar replacing white collar, but in every aspect including Full Self Driving, humanoid robot replacing housemaid. AGI will replace AI, and ASGI will replace AGI in 2030.

It is a great and grand topic and need some time to explain. What a small potato can do now? To learn AI at once, to invest AI at once. Not just investing in AI stocks, but invest yourself in the field of AI. AGI will be replaced by ASGI in 2030.
