- 1) Calm Period : between 10 to 20 points
- 2) Normal Period : between 20 to 30 points
- 3) Warning Period : between 30 to 40 points
- 4) Fear Period : between 40 to 50 points
- 5) Panic Period : Over 50 points

The CBOE Volatility Index (VIX) measures the market's expectation of 30-day volatility for the S&P 500 and is probably the most popular index concerning the fear of investors.

North East West South is NEWS

SpaceX plans to conduct its 13th integrated flight test of Starship on Thursday, July 16th, at 5:45 PM local time in Texas, with a 90-minute launch window. This mission will be the first to carry 20 truly next-generation Starlink V3 satellites into space, not the simulated satellites used in previous test flights. It will also attempt to land the Super Heavy booster at sea.

Elon Musk recently revealed that SpaceX plans to send its first supplies to the Moon and Mars by the end of this year, preparing for the establishment of a permanent base in the future. He further stated his hope to send tens of thousands of people to a lunar base within the next decade, gradually propelling humanity towards the space colonization era.

Last Friday, the U.S. Department of Commerce took the first step in easing export controls on the United Arab Emirates. Amazon, Apple, Google, Meta, Microsoft, OpenAI, Oracle, and xAI will receive simplified approval processes for some controlled equipment used in their data centers in the UAE, potentially accelerating chip sales by reducing individual applications. However, controls preventing sensitive technologies from flowing to restricted entities such as China remain unchanged.

The global expansion of artificial intelligence infrastructure is pushing the memory supply chain to its limits. SK Hynix CEO Guo Luzheng warned in an interview with Reuters that 2027 will be the tightest year in the history of the memory industry, with customer demand growing far faster than the company's capacity expansion. He expects the supply shortage to continue until after 2030.

A record-breaking heatwave swept across the central United States, shattering high-temperature records from the northern plains to the Rocky Mountains. Salt Lake City, the capital of Utah, and Billings, the largest city in Montana, both reached a high of 109 degrees Fahrenheit (approximately 43 degrees Celsius).

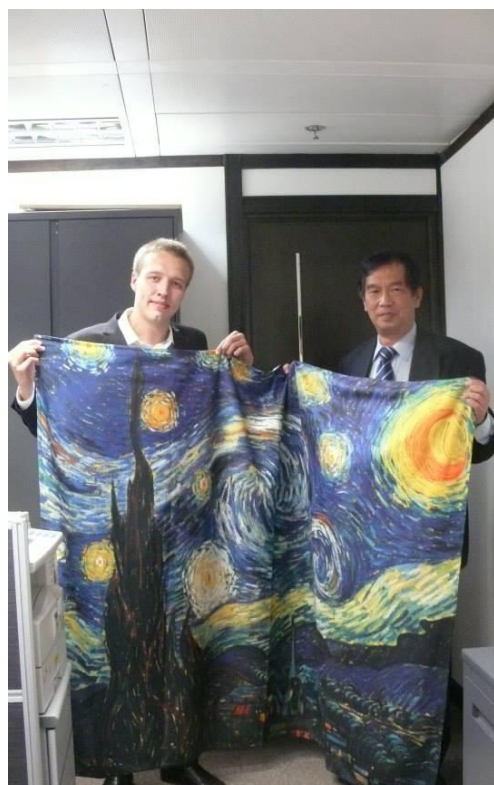

I just moved into my new studio in Kwun Tong (on Kowloon side) and ready to have first shooting on July 18 (Sat) and release on July 19 (Sun).

Space Exploration Of Elon Musk

Elon Musk is the richest person in the world in the year of 2022, 2025 and 2026. He owns 7 companies, but the most famous of all simply are TSLA and SPCX. Last year, the writer used nearly one whole year's time to emphasize the importance of Mars Landing stocks. China always wants to land on Mars earlier than the US, but after a series of competition, China announced the date of landing on Mars will be 2049 and landing on the Moon will be 2030. Thus, the US shifted the focus from Mars to the Moon. The re-landing on the Moon will be in 2028.

Now, Elon Musk again gives a new plan of space exploration. He wants to transport "tens of thousands" of people to the Moon. As a matter of fact, only 12 people have walked on the Moon since 1969. His aim is to establish a base on the Moon where normal people can go for vacation and send crews to the Moon in the next 2-3 years, to Mars in the next 5 years.

However, space exploration nowadays is more complicated, lower orbit of the earth is also of keen competition. The US has already sent 7,000 satellites to lower orbit and occupied the most favorable locations but China only sent 700. The secret of success in SPCX is that they can lower the cost of shooting reusable rockets and shorten the time of re-using after landing and also increase the weight of shooting each time. Now SPCX is aiming at the battlefield of medium orbit and they are in a favorable condition with their experience and manpower.

Another battlefield of space exploration is on the way, that is generation of electricity. The consumption of electricity in the AI industry is so enormous that all the plants on the earth will be saturated soon and need to establish solar plants

in the space for general electricity 24 hours a day. Japan is having their experiments and is quite near the watershed of success. Therefore, not just the orbit of the earth but the ring of the Moon project is on the way now. As the demand for chatting with AI is much greater than before, some people even suggest no need to say “thank you” to AI, for it is a waste of electricity. Thus, we can know that the shortage of electricity is quite near and space electricity generation is a MUST.

In the 1960s, before sending humans to space, they would send monkeys and dogs first, but it was also complained of cruelty to animals for the cabin was really too small. Now of course Landing on Mars will be done by robots first before human beings. Therefore, not only SPCX will be benefitted, TSLA surely is on the benefitted side because of Optimus humanoid robot.

So, we can come to a conclusion, AI is not a bubble, for the demand is not only on earth but in space also. Furthermore, space exploration is not just on the landing of the Moon, but also on Mars and orbit of the earth and electricity generation. When the industry or sector is promising, the daily fluctuation is not so important at all. Short term velocity is nothing but Dust in the Wind. When a stock drops, investors should know whether the fundamental factors had already changed or just technical shuffling. That is, we must know if there are any changes in the original plan such as already found another method of generation of electricity on earth and no need to go so far into space, or just technical adjustment or rebound.

Some people would ask why Elon Musk gave out such a plan of exploration in the space industry. Some would say because the price of SPCX is low. When you think it is low and this should be time for buying. Once Warren Buffett, the god of stocks, said the performance of Wall Street fund managers cannot be better than the market (the indices). Therefore, recently, a lot of investors turned to buy the ETF which is a basket of stocks instead of a single stock. This can be said as a disperse of risks. After all, we still have to see what the position of the market is. That is the position of S&P (page 7).

When observing the pattern, S&P is transforming to Ascending Triangle, and MACD, RSI and Stochastic Slow all shown upward trend.
